REVERSAROLLER

Backward winch guide

By the staff of Dirt Wheels

When not in use, the ReversaRoller stows away in the Can-Am's storage compartment in its own protective bag.

We have already used the ReversaRoller to explore new sections of our favorite ride area. Now, trails that were only passable on a dirt bike or on foot can be explored on our quads.

The ReversaRoller installs in minutes, replacing your winch's fair lead. It's made of quality materials that will add value to any utility quad.

sists of a new roller fair lead with an extra roller positioned lower and out from the stock bottom roller.

Next, a frame with a quick pin release gets connected to the new fair lead and runs along your front skid plate. This frame carries another roller position right in center of your quad between the two front wheels.

Now you can run your winch cable under your quad and out the back. A stainless steel hardware clip mounted under your hitch location further guides the winch cable. It also adds an element of safety to keep the quad from doing an endo down a steep hill.

INSTALL & EXPLORE

Installation on our Can-Am Outlander 800XT took about 30 minutes. The construction of the ReversaRoller is flawless. The frame is made from powdercoated, cold-rolled steel. The rollers are zinc-coated, as are the mounting bolts. When not in use, the ReversaRoller fits in the on-board Outlander cargo box in its own storage bag. On the trail, installation and removal takes less than one minute.

A strong stainless steel I-Bolt gets installed in the rear hitch mount to guide the winch cable. This piece also keeps the ATV from doing an endo on the very steep descents.

With the ReversaRoller installed, we were able to explore some uncharted territory at our favorite ridespot. Trails that have terrain too steep for quads became accessible. We're always adding new sections to our test courses, and the ReversaRoller is coming in handy. For casual riding, the product has rescued us from a mud pit, a deep water crossing and has also helped out several other quads in our riding group.

The ReversaRoller is a product to get excited about. It is of very high-quality construction and serves a purpose not only to extend our trail exploring, but also adds a safety factor to all of our trips.

The ReversaRoller is also available for the Yamaha Grizzly, Honda Rincon, new Polaris Sportsman XPs and full-sized Arctic Cat ATVs, and they range in price from \$210-\$245. Contact ReversaRoller at (801) 796-7066 or view some crazy videos of the ReversaRoller in action at www.reversaRoller.com. □

□ It's not every day that we get to test an entirely new product in the ATV market. This month, we are testing two. On page 57 we evaluated the unique new Toy Loader, and on this page, the ReversaRoller. The ReversaRoller is a winch cable guide that allows you to attach your ATV's front-mounted winch to point behind the machine.

This can be convenient and necessary in a number of ways. One, you might head down a narrow trail that appears to be safe only to turn very steep. You may also be able to climb a hill, but the 2WD quad your buddy is riding on with may not.

In either case, you can unspool your winch line and route it under your machine to the anchor point.

To make this happen in a correct manner, the \$215 ReversaRoller con-
